EF Maps Differently Than Most ORMs

Entity Framework Core: Getting Started

★★★★☆

By Julie Lerman

This course helps those with experience in earlier versions of EF and EF Core, and developers completely new to Entity Framework. Learn how to build data models with EF Core 3.1, use EF Core to let your software interact with data in your databases and incorporate EF Core in your automated tests.

Course Overview

State of EF6 in 2020

Minor updates since EF6 release in 2013. 6.4 released in Dec 2019

See the “What’s New” page for EF6 in MS docs
docs.microsoft.com/en-us/ef/ef6/what-is-new/past-releases

Everything continues to work in Visual Studio 2019

Most interesting change was that EF6 was ported to .NET Core 3
I wrote an article about it in 2019: bit.ly/EF6NetCore3

This Course

High level view of EF6

Creating a model with code

Use EF's DbContext between model & DB

Your model & EF in client & server apps

This Module

What is Entity Framework?

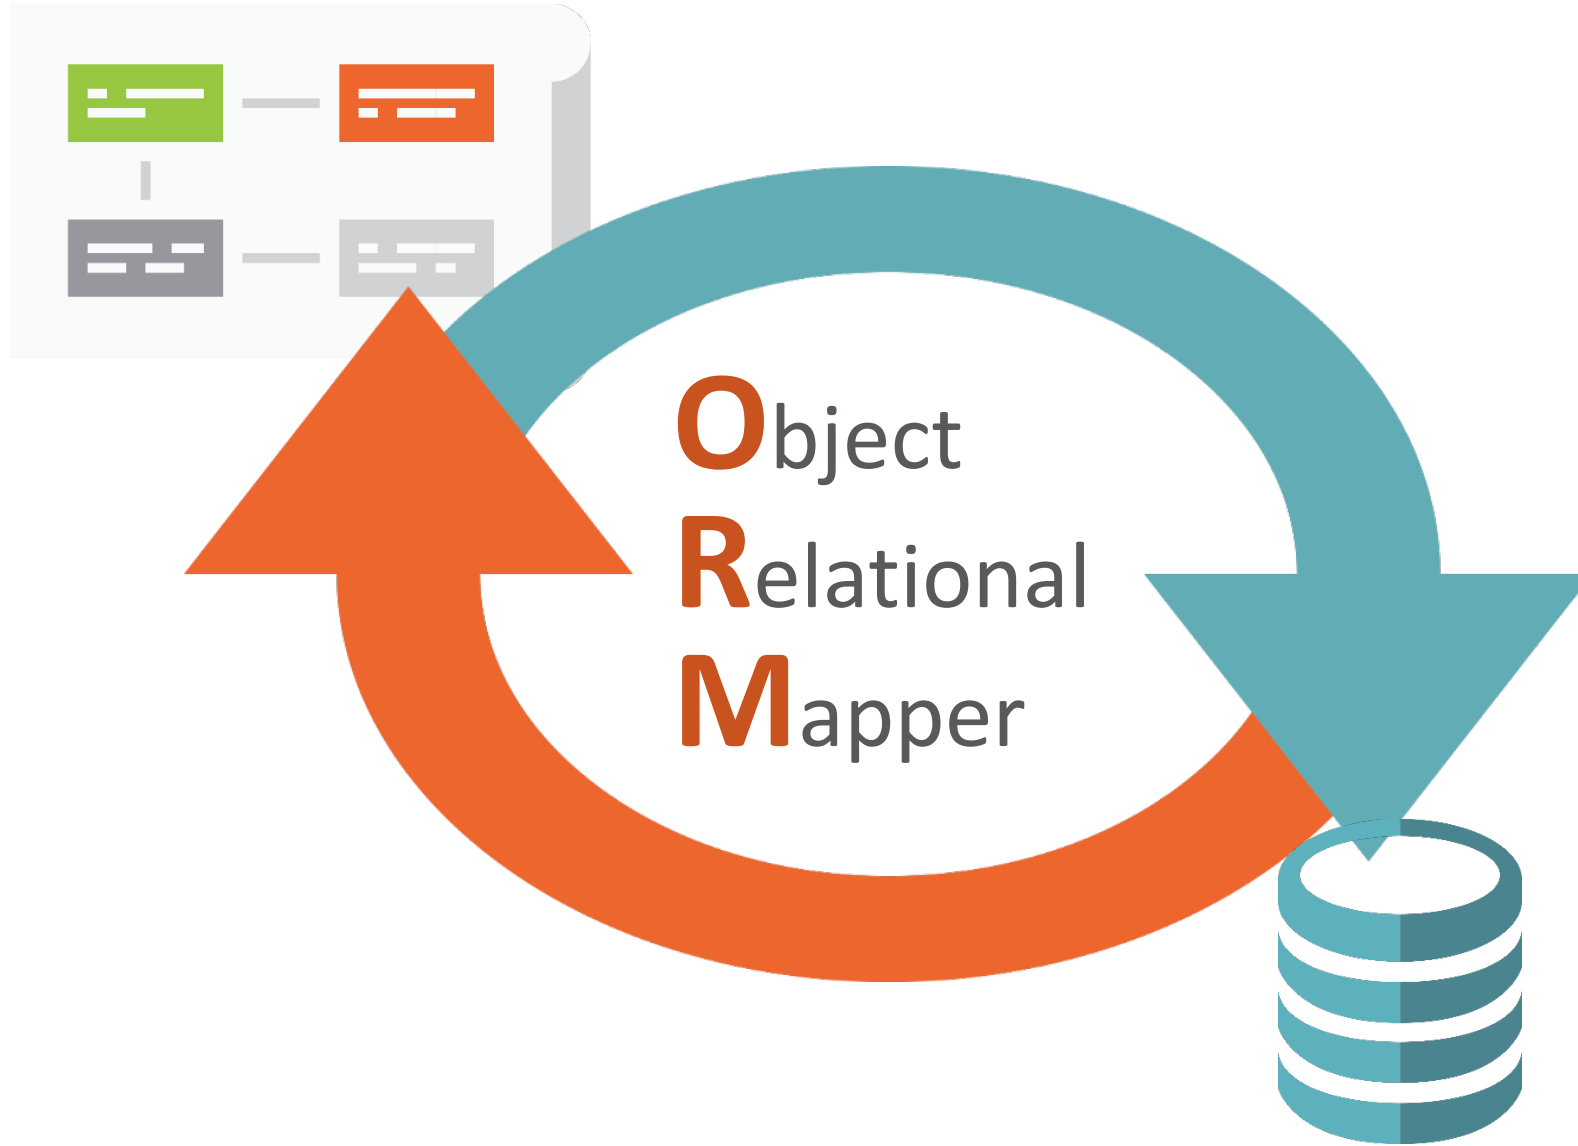

Why use Entity Framework?

A brief history in EF time

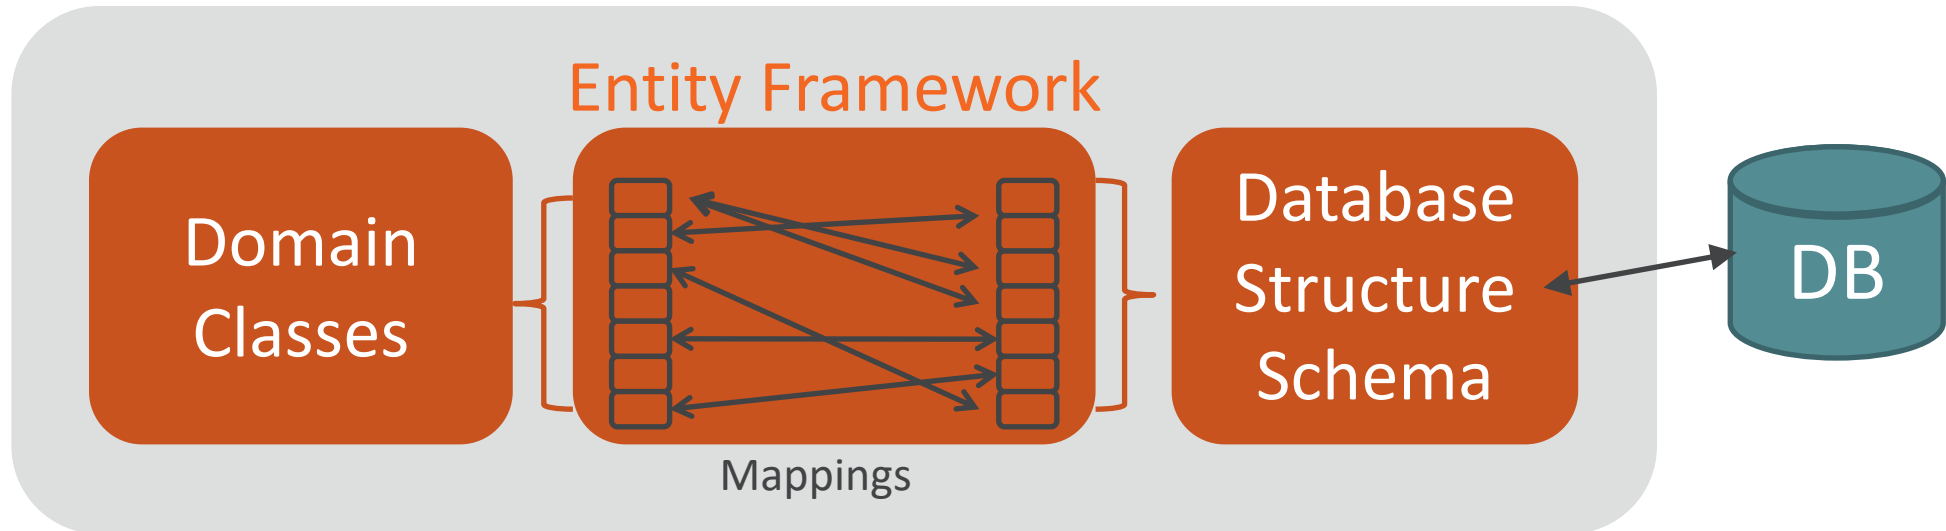

Where EF fits in your architecture

Should you use EF6 or EF Core?

What is Entity Framework?

EF vs Other ORMs

Why Entity Framework?

Developer
Productivity

First Class Member
of
Microsoft .NET Stack

Consistent query
syntax with
LINQ to Entities

Focus on domain.
Not on DB,
connections,
commands, etc.

Where to Use Entity Framework 6

.NET 4, .NET 4.5, .NET 4.5.1, .NET 4.6

WPF

Windows Forms

Console Application

Client Side

ASP.NET MVC Controller

ASP.NET Web API

ASP.NET Web Forms

WCF Services

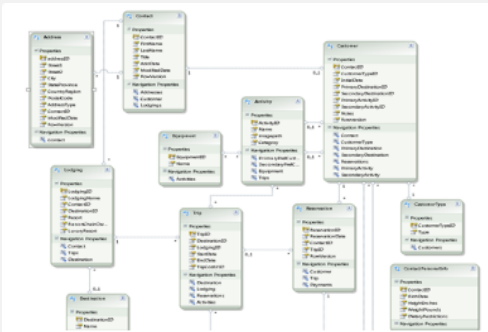

WCF Data Services

Windows Services

Server Side

How EF Works

Your Classes

(via *Designer + Code Gen*
or *Your Code*)

Entity Framework API

Map Classes to Database Schema

Translate & Execute Queries

Track Changes

Infer
&
Execute
Updates

Relational DB

Code First Mappings

```
public class Customer
{
    public int Id {get;set;}
    public string FirstName {get;set;}
    public DateTime DateOfBirth {get;set;}
}
```

Conventional Mapping

Column Name="First_Name", Length=30

Conventional Mapping

Table Name: Customers

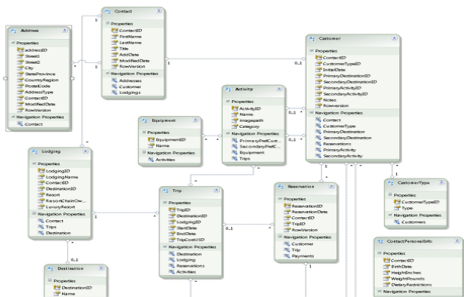

Id (PK, int, not null)

First_Name(nvarchar(30),not null)

DateOfBirth(date, not null)

Basic Workflow

Define model

Express & execute query

(from p in
people select
p).ToList()

EF determines
& executes SQL

Select * from
people

EF transforms results
into your types

3	Ms.	Donnie	F.	Carreras
4	Ms.	Janet	M.	Gates
5	Mr.	Lucy	NULL	Harrington
6	Mr.	Joop	X.	Carroll
7	Mr.	Dominic	P.	Gash
10	Ms.	Kathleen	M.	Garza
11	Ms.	Kathleen	NULL	Harding
12	Mr.	Johnny	A.	Caprio
16	Mr.	Christopher	R.	Beck
18	Mr.	David	J.	Liu
19	Mr.	John	A.	Beaver

To get started, provide us with the following information:

Email: <input type="text"/>	Job title: <input type="text"/>
First name: <input type="text"/>	Phone: <input type="text"/>
Last name: <input type="text"/>	User Name: <input type="text"/>
Company: <input type="text"/>	Password: <input type="text"/>
How did you hear about us? <input type="text"/>	Confirm it: <input type="text"/>

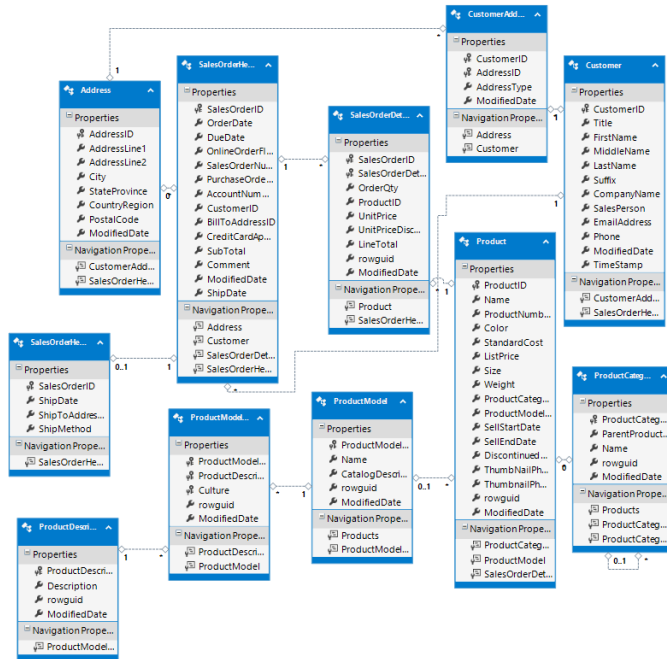

Modify data

EF SaveChanges

EF determines & executes SQL

UPDATE people
SET Firstname='Julie'
WHERE id=3

Model Options

```
public partial class Customer
{
    public Customer()
    {
        this.CustomerAddresses = new HashSet<CustomerAddress>();
        this.SalesOrderHeaders = new HashSet<SalesOrderHeader>();
    }

    public int CustomerID { get; set; }
    public string Title { get; set; }
    public string FirstName { get; set; }
    public string MiddleName { get; set; }
    public string LastName { get; set; }
    public string Suffix { get; set; }
    public string CompanyName { get; set; }
    public string SalesPerson { get; set; }
    public string EmailAddress { get; set; }
    public string Phone { get; set; }
    public System.DateTime ModifiedDate { get; set; }
    public byte[] TimeStamp { get; set; }

    public virtual ICollection<CustomerAddress> CustomerAddresses { get; set; }
    public virtual ICollection<SalesOrderHeader> SalesOrderHeaders { get; set; }
}
```

Model.EntityType="Customer"

Property.Name="Title"

Key.Name="First_Name"

Storage.EntityType="Customer"

Property.Name="Title"

Key.Name="First_Name"

Mapping:

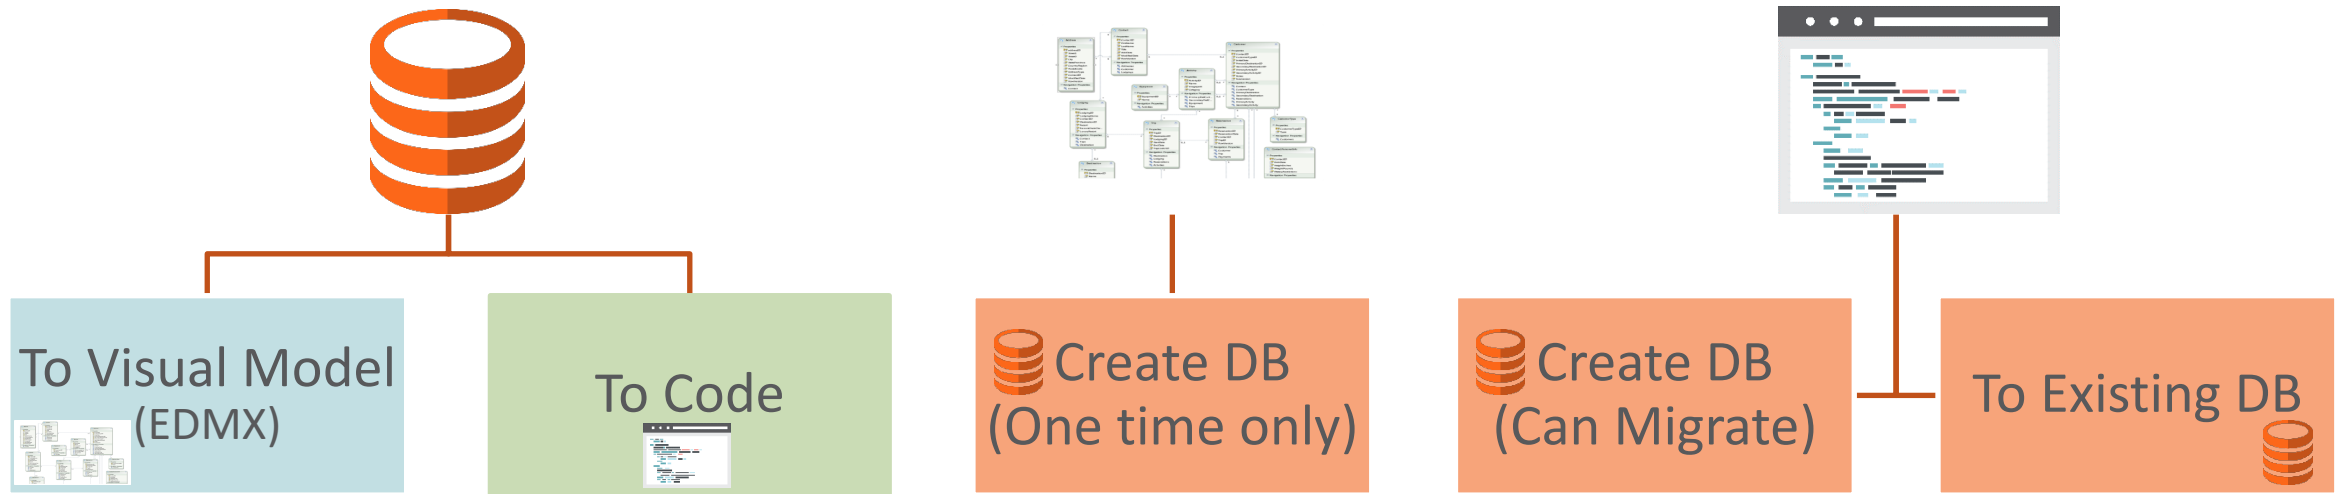

[Model.Entity("Customer"),
Storage.Entity("Customers")]
[Model.Property("FirstName"),
Storage.Property("First_Name")]

```
public class Customer : Contact
{
    public Customer(string firstName, string lastName, string email)
    {
        FullName = new FullName(firstName, lastName);
        EmailAddress = email;
        Status = CustomerStatus.Silver;
    }

    public Customer() { }
    public string SalesPersonId { get; private set; }
    public CustomerStatus Status { get; private set; }
    public Address ShippingAddress { get; private set; }
    public Address BillingAddress { get; private set; }
    public CustomerCreditCard CreditCard { get; private set; }
    public void SetShippingAddressBillingAddress()
    {
        ShippingAddress = new Address
        {
            Street1 = BillingAddress.Street1,
            City = BillingAddress.City,
            PostalCode = BillingAddress.PostalCode
        };
    }

    public void CreateNewShippingAddress(string street, string city, string zip)
    {
        BillingAddress = new Address
        {
            Street1 = street,
            City = city,
            PostalCode = zip
        };
    }
}
```

EF6 usage in .NET Framework apps is significant. That's why we ported it to .NET Core. 😊
